What Are Femtocells?

Femtocells are small, low-power cellular base stations designed to improve indoor mobile coverage and capacity. Typically, they are compact devices that connect to the service provider's core network via broadband internet (such as DSL or fiber). Femtocells act as mini-cell towers within homes, offices, or other enclosed spaces, providing a localized cellular signal that enhances connectivity for users within their vicinity.

Key Characteristics of Femtocells:

- Size and Power:** Usually the size of a router or small box, with minimal power consumption.
- Coverage Area:** Typically covers a radius of 10 to 50 meters, ideal for homes or small business environments.
- Connectivity:** Connects to the operator's core network through the user's broadband connection.
- User Capacity:** Supports multiple users simultaneously, depending on the device specifications.

How Femtocells Work

Femtocells function as localized cellular access points. When a mobile device enters the femtocell's coverage area, it automatically connects to the femtocell instead of the macrocell (the larger cell tower). This connection allows for:
