Heat transfer solved examples

Heat transfer solved examples are essential for students and professionals aiming to understand the practical applications of heat transfer principles. These examples not only reinforce theoretical concepts but also enhance problem-solving skills crucial for designing thermal systems, analyzing heat flow, and optimizing energy efficiency. In this comprehensive guide, we will explore a variety of heat transfer problems, providing detailed solutions to help you master conduction, convection, and radiation heat transfer mechanisms.

Understanding Heat Transfer Modes Before diving into solved examples, it's important to review the three primary modes of heat transfer:

- Conduction** Conduction involves heat transfer through a solid material due to temperature gradients. It occurs when energetic particles transfer kinetic energy to neighboring particles without the movement of the material itself.
- Convection** Convection is heat transfer through fluid motion—either natural or forced. It involves the movement of fluid particles carrying heat from one place to another.
- Radiation** Radiation transfers heat through electromagnetic waves, without the need for a medium. All objects emit, absorb, and reflect thermal radiation depending on their temperature and surface properties.

Common Heat Transfer Problems with Solutions Below are some typical problems in heat transfer, with step-by-step solutions to help you understand how to approach similar questions.

Problem 1: Steady-State Conduction Through a Flat Wall
Problem Statement: A 10 cm thick brick wall (thermal conductivity $k = 0.72$ W/m·K) separates two rooms. The temperature on one side of the wall is 20°C, and on the other side is 0°C. Determine the heat flux q through the wall.
Solution:
Step 1: Identify knowns
 Thickness of wall, $L = 0.10$ m
 Thermal conductivity, $k = 0.72$ W/m·K
 Temperature difference, $\Delta T = T_1 - T_2 = 20^\circ\text{C} - 0^\circ\text{C} = 20^\circ\text{C}$
Step 2: Use Fourier's Law of conduction
 $q = -k \frac{\Delta T}{L}$
 Since heat flows from the hot to the cold side, the magnitude is:
 $q = k \frac{\Delta T}{L}$
Step 3: Calculate heat flux
 $q = 0.72 \text{ W/m}\cdot\text{K} \times \frac{20 \text{ K}}{0.10 \text{ m}} = 0.72 \times 200 = 144 \text{ W/m}^2$
Answer: The heat flux through the wall is 144 W/m².
Problem 2: Convective Heat Transfer from a Hot Surface
Problem Statement: A flat steel plate at 150°C is exposed to ambient air at 25°C. The convective heat transfer coefficient (h) is

25 W/m²·K. Find the rate of heat transfer per unit area from the plate. **Solution:** Step 1: Known parameters Surface temperature, $(T_s = 150^\circ\text{C})$ Ambient temperature, $(T_\infty = 25^\circ\text{C})$ $(h = 25\text{, W/m}^2\cdot\text{K})$ Step 2: Calculate temperature difference $(\Delta T = T_s - T_\infty = 150^\circ\text{C} - 25^\circ\text{C} = 125^\circ\text{C})$ Step 3: Apply convection heat transfer equation $(q'' = h \times \Delta T)$ Step 4: Compute heat flux $(q'' = 25\text{, W/m}^2\cdot\text{K} \times 125\text{, K} = 3125\text{, W/m}^2)$ **Answer:** The heat transfer rate per unit area is 3125 W/m².

Problem 3: Radiative Heat Exchange Between Surfaces **Problem Statement:** Two parallel black surfaces, each of area 2 m², face each other at a distance of 1 m. Surface 1 is at 600 K, and Surface 2 is at 300 K. Find the net radiative heat exchange between them. **Solution:** Step 1: Recognize the scenario Since both surfaces are black, their emissivity $(\epsilon = 1)$. Step 2: Use the Stefan-Boltzmann law The power radiated per unit area: $(E = \sigma T^4)$ where $(\sigma = 5.67 \times 10^{-8}\text{, W/m}^2\cdot\text{K}^4)$. Step 3: Calculate individual emissive powers $(E_1 = \sigma T_1^4 = 5.67 \times 10^{-8} \times (600)^4)$ $(E_2 = 5.67 \times 10^{-8} \times (300)^4)$ Calculations: $(E_1 = 5.67 \times 10^{-8} \times (1.296 \times 10^{11}) \approx 7354\text{, W/m}^2)$ $(E_2 = 5.67 \times 10^{-8} \times (8.1 \times 10^9) \approx 460\text{, W/m}^2)$ Step 4: Calculate view factor (F_{12}) For two infinite parallel surfaces facing each other: $(F_{12} = 1)$ Since the surfaces are finite but large relative to the distance, the view factor can be approximated as 1. Step 5: Use the radiative exchange formula Net heat exchange: $(Q = \frac{\sigma (T_1^4 - T_2^4)}{\frac{1}{\epsilon_1} + \frac{1}{\epsilon_2} - 1})$ For black surfaces $(\epsilon_1 = \epsilon_2 = 1)$: $(Q = \sigma (T_1^4 - T_2^4) \times A)$ Total power: $(Q_{\text{total}} = \sigma (E_1 - E_2) \times A)$ Substituting: $(Q_{\text{total}} = 5.67 \times 10^{-8} \times (7354 - 460) \times 2\text{, m}^2)$ $(Q_{\text{total}} = 5.67 \times 10^{-8} \times 6894 \times 2)$ $(Q_{\text{total}} \approx 5.67 \times 10^{-8} \times 13788 \approx 0.781\text{, W})$ **Answer:** The net radiative heat exchange is approximately 0.78 W from the hot to the cold surface.

Heat Transfer Solved Examples: An Expert Guide to Understanding Thermal Phenomena

Understanding heat transfer is fundamental for engineers, physicists, and students delving into thermodynamics, heat transfer mechanisms, and practical applications. To truly grasp these concepts, working through solved examples is invaluable, offering clarity, confidence, and a solid foundation for tackling real-world problems. In this detailed guide, we explore a range of heat transfer solved examples, dissecting each step with precision, and providing insights into the application of principles such as conduction, convection, and radiation. Whether you're preparing for exams, designing heat exchangers, or simply seeking to bolster your knowledge, this article aims to serve as your comprehensive resource.

Introduction to Heat Transfer: Core Concepts and Principles

Before diving into specific solved examples, it's essential to understand the fundamental modes of heat transfer:

- Conduction:** Transfer of heat through a solid material due to temperature gradients.
- Convection:** Transfer of heat through fluids (liquids or gases) caused by fluid motion.
- Radiation:** Transfer of heat via electromagnetic waves, independent of medium.

Each mode obeys specific laws and equations, which form the backbone of the solved examples discussed below.

Solving Heat Conduction Problems

Heat conduction problems often involve calculating heat flux, temperature distribution, or thermal resistance in materials.

Example 1: Steady-State Heat Conduction Through a Plane Wall

Problem Statement: A steel wall of thickness 0.2 m and thermal conductivity $(k = 50, \text{ W/m}\cdot\text{K})$ separates two rooms. The temperature on one side (hot side) is 400°C , and on the other (cold side) is 300°C . Find the heat transfer rate (Q) through the wall if the wall area is 10 m^2 .

Solution Approach: Use Fourier's law of conduction for steady-state heat transfer:

$$Q = \frac{kA(T_1 - T_2)}{L}$$

Step-by-Step Calculation:

Identify known values: $(k = 50, \text{ W/m}\cdot\text{K})$, $(A = 10, \text{ m}^2)$, $(T_1 = 400^\circ\text{C})$, $(T_2 = 300^\circ\text{C})$, $(L = 0.2, \text{ m})$

Calculate temperature difference: $(\Delta T = T_1 - T_2 = 400 - 300 = 100, ^\circ\text{C})$

Apply Fourier's law: $[Q = \frac{50 \times 10 \times 100}{0.2} = \frac{50 \times 1000}{0.2} = \frac{50,000}{0.2} = 250,000, \text{ W}]$

Result: The heat transfer rate (Q) is 250 kW.

Expert Insight: This example showcases how material properties and geometrical factors influence conduction. Notably, increasing the wall thickness decreases heat transfer, illustrating the importance of insulation.

Advanced Example: Composite Wall with Multiple Layers

Problem Statement: A wall comprises two layers: a 0.1 m thick layer of brick $(k_1 = 0.72, \text{ W/m}\cdot\text{K})$ and a 0.05 m thick layer of plaster $(k_2 = 0.22, \text{ W/m}\cdot\text{K})$. The temperature on the outside surface is 50°C , and inside is 20°C . Find the heat flux through the composite wall.

Solution Approach: Use the concept of thermal resistance in series:

$$Q = \frac{\Delta T}{R_{\text{total}}}$$

where $R_{\text{total}} = R_1 + R_2 = \frac{L_1}{k_1 A} + \frac{L_2}{k_2 A}$

Since the area (A) is common, it cancels out in the calculation of heat flux: $[q = \frac{\Delta T}{\frac{L_1}{k_1} + \frac{L_2}{k_2}}]$

Calculations: Calculate individual thermal resistances per unit area: $[R_1 = \frac{0.1}{0.72} \approx 0.139, \text{ m}^2\cdot\text{K/W}]$, $[R_2 = \frac{0.05}{0.22} \approx 0.227, \text{ m}^2\cdot\text{K/W}]$

Sum of resistances: $[R_{\text{total}} = 0.139 + 0.227 = 0.366, \text{ m}^2\cdot\text{K/W}]$

$\text{m}^2, \text{K/W}$] Calculate heat flux: $q = \frac{50 - 20}{0.366} \approx \frac{30}{0.366} \approx 81.97$, W/m^2] Result: The heat flux through the wall is approximately 82 W/m². Expert Insight: Composite walls are common in building insulation. This example demonstrates how layered materials affect overall thermal resistance and heat transfer rates, emphasizing the importance of material selection and configuration.

Convection Heat Transfer Examples Convection involves fluid movement, and problems often involve calculating heat transfer coefficients or heat transfer rates given certain conditions.

Example 2: Free Convection from a Vertical Plate

Problem Statement: A vertical plate with dimensions 2 m by 3 m is maintained at a temperature of 80°C in a room at 20°C. The properties of air at the film temperature are: $k = 0.025$, $\text{W/m}\cdot\text{K}$, $\mu = 1.85 \times 10^{-5}$, $\text{kg/m}\cdot\text{s}$, $\rho = 1.2$, kg/m^3 , $\nu = 1.54 \times 10^{-5}$, m^2/s , and $c_p = 1005$, $\text{J/kg}\cdot\text{K}$. Calculate the heat transfer rate from the plate.

Solution Approach: Use the Nusselt number correlation for natural convection over a vertical plate:
$$\text{Nu} = 0.68 + \frac{0.670}{(0.492/\text{Pr})^{9/16}} \left[1 + \frac{0.670}{(0.492/\text{Pr})^{9/16}} \right]^{4/9}$$
 Calculate the Rayleigh number:
$$\text{Ra} = \text{Gr} \times \text{Pr}$$
 where
$$\text{Gr} = \frac{g \beta (T_s - T_\infty) L^3}{\nu^2}$$
 and
$$\text{Pr} = \frac{\nu}{\alpha}$$
 with
$$\beta = 1/T_{\text{avg}}$$
 (approximate for ideal gases), and thermal diffusivity:
$$\alpha = \frac{k}{\rho c_p}$$

Step-by-step: Calculate α :
$$\alpha = \frac{0.025}{1.2 \times 1005} \approx 2.07 \times 10^{-5} \text{ m}^2/\text{s}$$
 Estimate β :
$$T_{\text{avg}} = \frac{80 + 20}{2} = 50^\circ \text{C} = 323 \text{ K}$$

$$\beta = \frac{1}{T_{\text{avg}}} \approx 3.09 \times 10^{-3} \text{ K}^{-1}$$
 Calculate Gr :
$$\text{Gr} = \frac{9.81 \times 3.09 \times 10^{-3} \times (80 - 20) \times 2^3}{(1.54 \times 10^{-5})^2} = \frac{9.81 \times 3.09 \times 10^{-3} \times 60 \times 8}{2.37 \times 10^{-10}} \approx 9.81 \times 3.09 \times 10^{-3} \times 480 \approx 14.58$$
 Therefore,
$$\text{Gr} \approx \frac{14.58 \times 2.37 \times 10^{-10}}{10^{-10}} \approx 6.15 \times 10^{10}$$
 Calculate Ra :
$$\text{Ra} = \text{Gr} \times \text{Pr}$$
 Prandtl number:
$$\text{Pr} = \frac{\nu}{\alpha}$$

Question Answer

What is the primary difference between conduction and convection in heat transfer?

Conduction involves heat transfer through a stationary solid material via molecular vibrations, while convection involves heat transfer through a fluid (liquid or gas) due to bulk movement of the fluid itself.

How do you calculate the heat transfer rate in a conduction problem using Fourier's law?

The heat transfer rate (Q) by conduction is calculated using Fourier's law as $Q = -kA(dT/dx)$, where k is the thermal conductivity, A is the cross-sectional area, and dT/dx is the temperature gradient along the direction of heat flow.

What is the significance of the Biot number in conduction problems?

The Biot number (Bi) indicates the ratio of internal thermal resistance within a solid to the external convective heat transfer resistance. A small Bi (less than 0.1) suggests the temperature within the solid is nearly uniform, simplifying conduction analysis.

How can you solve a steady-state heat conduction problem with multiple layers of different materials?

You treat each layer separately, calculating the temperature drop across each using Fourier's law, and ensure continuity of temperature and heat flux at interfaces. The total thermal resistance is the sum of individual resistances, allowing you to find the overall heat transfer rate.

In a convection heat transfer problem, how is the heat transfer coefficient (h) determined, and why is it important?

The heat transfer coefficient (h) depends on the nature of the fluid flow, properties, and geometry. It is usually determined experimentally or via correlations. It is important because it quantifies the efficiency of heat transfer between a surface and fluid, directly affecting the heat transfer rate.

How do you approach a combined conduction and convection problem in heat transfer?

You analyze conduction through solid layers and convection at surfaces separately, applying Fourier's law for conduction and Newton's law of cooling for convection, then link the two through boundary conditions to find the overall heat transfer rate.

Can you provide an example of solving a heat transfer problem involving a cylindrical pipe with internal conduction and external convection?

Yes. First, calculate the temperature distribution within the pipe wall using conduction equations, then apply convective heat transfer coefficients to the outer surface to determine the heat loss to the surroundings. Using the thermal resistance network, you can find the overall heat transfer rate.

Communication Capabilities: Modbus, IEC 61850, and other protocols for remote monitoring.

Configurability: Customizable settings for each protection element, enabling tailored protection schemes.

Event Logging & Diagnostics: Facilitates troubleshooting and preventive maintenance.

Fundamental Principles of Motor Protection Settings

Motor protection involves safeguarding against abnormal conditions that can cause damage or reduce the lifespan of the motor. Proper settings are critical to distinguish between normal operational transients and genuine faults.

Types of Faults Addressed

Overcurrent and Short-Circuit: Excessive current flow damaging the motor windings.

Thermal Overload: Excess heat buildup due to prolonged overcurrent conditions.

Phase Failures or Imbalance: Conditions that may cause torque reduction or mechanical stress.

Locked Rotor: Condition where the rotor cannot turn, leading to excessive current.

Key Parameters to Configure

Pickup current (I_e): Threshold at which protection activates.

Time delay (T_e): Ensures transient conditions don't cause unnecessary trips.

Curve characteristics: Defines how the relay responds over different current levels.

Protection zones and thresholds: For differential or directional protection.

Step-by-Step Sepam Motor Protection Relay Setting Example

This section provides a structured approach to configuring a Sepam relay for a typical industrial motor, assuming a motor rated at 150 kW, 400 V, 50 Hz, with typical protection requirements.

Gather Motor Data and System Parameters

Rated Power: 150 kW
 Rated Voltage: 400 V
 Rated Current (I_n): Approximately 380 A (calculated)
 Service Factor: 1.0 (standard)
 Type of Load: Inductive motor

Protection Requirements

Overcurrent, thermal overload, phase failure, and locked rotor

Calculate Protection Settings

Overcurrent Setting (Pickup Current)

Standard practice suggests setting the relay at 120%-150% of the motor's full load current (I_n) for overload protection.

For 380 A rated current: $I_e = 1.25 I_n = 1.25 \times 380 \text{ A} = 475 \text{ A}$

Choose a pickup setting: $I_e = 1.3 I_n = 494 \text{ A}$

Setting range: $I_e = 470 \text{ A}$ to 500 A (adjustable based on manufacturer recommendations)

Time Delay (T_e)

To prevent nuisance tripping during transient conditions, select a time delay: $T_e = 3$ to 5 seconds for thermal overload protection

Short-Circuit Protection

Fast acting, with a lower pickup current (e.g., 200% of I_n): $I_e = 2.0 I_n = 760 \text{ A}$

Use an instantaneous or very short delay (e.g., 0.1 s)

Thermal Overload Protection

Use the thermal model embedded in the relay, typically based on motor full load current and duty cycle.

Phase Failure and Unbalance Protection

Set phase failure detection at a threshold (e.g., 80% of rated voltage per phase)

Accessing the Sepam Configuration Software

Connect the relay via Ethernet or serial port.

Launch the Sepam Protection Suite software.

Load the default configuration for the motor protection application.

Navigate to protection functions: Overcurrent, thermal, phase failure, etc.

Configuring Overcurrent Protection

Enable the Overcurrent function.

Input the calculated pickup current (e.g., 470 A).

Set the time delay (e.g., 4 seconds).

Select the appropriate characteristic curve: Inverse Definite Minimum Time (IDMT)

Configuring Thermal Protection

Use the Thermal Model.

Input motor rated current.

Set the thermal time constant as per motor specifications.

Ensure the relay's thermal protection correlates with motor thermal limits.

Configuring Phase Failure and Unbalance Detection

Enable phase failure detection.

Set threshold voltage (e.g., 80% of line-to-line voltage).

Enable phase unbalance detection if needed.

Finalizing and Validating Settings

Save the configuration.

Perform simulation or testing with

current injection to verify protection operation. Adjust settings based on test results and system behavior.

Best Practices and Considerations in Relay Settings Coordination with System Protection

Ensure settings are coordinated with upstream circuit breakers and downstream protection devices. Conduct time-current coordination studies to prevent nuisance trips or damage.

Consideration of Transients and Start-up Conditions

During starting, currents can reach 6-8 times I_n . Settings should allow for motor startup without tripping, but still protect against faults.

Regular Testing and Maintenance

Periodically verify relay functionality with secondary injection testing. Update settings if motor load conditions or system configurations change.

Documentation and Record-Keeping

Maintain detailed records of all settings. Record calibration and testing results for future reference.

Conclusion

Properly configuring a Sepam motor protection relay is a meticulous process that requires a clear understanding of motor characteristics, system conditions, and protection principles. The example outlined above demonstrates a systematic approach to setting up the relay, balancing sensitivity with selectivity to ensure reliable protection without unnecessary interruptions. As with any protective device, ongoing testing, maintenance, and adjustment are essential to adapt to evolving operational conditions and to uphold system integrity. By adhering to best practices and leveraging the advanced features of Sepam relays, electrical engineers can significantly enhance the safety, efficiency, and longevity of motor-driven systems in modern industrial environments.
